Soyamo Vakala

Johannesburg, South Africa | 065-938-6561 | lloydsoyamo@gmail.com | linkedin.com/in/svakala | github.com/Soyamo

Professional Summary

Computer Science Honours graduate with a Software Development focus and hands-on experience building backend services, RESTful APIs, database-driven applications, and cloud-deployed systems. Experienced with Python, C#, Java, FastAPI, Flask, ASP.NET Core, PostgreSQL, MySQL, Docker, and CI/CD. Currently developing a full-stack hardware store platform focused on inventory management, product catalogues, and order reservation workflows. Strong interest in building practical, scalable software and growing within a professional engineering team.

Education

University Of Johannesburg — Johannesburg, South Africa
Bachelor of Science Hons. in Computer Science — *Feb. 2025 – Nov 2025*

North-West University — Potchefstroom, South Africa
Bachelor of Science in Information Technology — *Feb. 2022 – Nov 2024*

Projects

Hardware Store Platform | *Python, FastAPI, PostgreSQL, SQLAlchemy, REST API* — June 2026 – Present

- Developing a reusable full-stack platform for independent hardware stores to manage products, categories, inventory, and customer orders.
- Building RESTful backend services with FastAPI and SQLAlchemy, backed by PostgreSQL for persistent application data
- Implemented product and category management, including support for parent categories and subcategories.
- Developed an order reservation workflow that tracks stock availability and order states from pending through confirmation, collection, cancellation, or expiry
- Implemented inventory logic to reserve stock during order processing while maintaining available quantities.

DeepGuard Detection System | *Python, Flask, SQLite, Git, TensorFlow, Google Colab* — Feb 2025 – Present

- Developed an AI-powered web application for image and video deepfake detection
- Implemented secure authentication, admin controls, and detection history tracking
- Trained CNN, LSTM, and Transformer models achieving 92% detection accuracy.
- Integrated real-time frame-by-frame heatmaps for visual explainability

Transaction Anomaly Tracker | *Python, Flask, MySQL, Docker, Gitlab, Google Cloud* — Aug 2025 – Oct 2025

- Built a full-stack transaction monitoring system with complete CRUD functionality for anomaly and fraud detection.
- Designed and automated a CI/CD pipeline covering testing, containerisation, and security scanning.
- Deployed to Google Cloud Run via Artifact Registry, reducing deployment time by 65%

Museum Ticket System | *C#, ASP.NET, MySQL* — Feb 2023 – Nov 2023

- Built a C#.NET ticketing application for managing museum visitors and ticket sales, implementing CRUD operations and SQL database integration.
- Designed a normalised SQL Server database schema with referential integrity constraints.
- Developed a Windows Forms front-end with input validation, error handling, and user-friendly interface

Technical Skills

Languages: Java, Python, C#, SQL, JavaScript, HTML/CSS
Frameworks: ASP.NET, Flask, FastAPI
Cloud & DevOps: Google Cloud Run, Artifact Registry, Docker, CI/CD, AWS (self-study)
AI / ML Libraries: TensorFlow, CNNs, LSTMs, Transformers
Developer Tools: GitLab, GitHub, VS Code, Visual Studio, Eclipse, Google Colab
Database: MySQL, PostgreSQL, SQLite, Oracle SQL, SQL Server
Soft Skills: Team collaboration, problem-solving, communication, attention to detail, critical thinking
